

Neuralangelo Training Config Comparison

Official: C:\research\neuralangelo_test\outputs\chair\chair_from_nerf2mesh_official

Better: C:\research\neuralangelo_test\outputs\chair\chair_from_nerf2mesh_better

Only four saved config entries differ between these two runs. The dataset path, image sizes, batch size, model structure, render sampling, optimizer, scheduler, and loss weights are the same.

Parameter	Official	Better	Meaning
checkpoint.save_iter	20000	50000	Better saves checkpoints less often.
trainer.amp_config.enabled	false	true	Better enables AMP mixed precision for speed and VRAM savings.
validation_iter	5000	10000	Better runs validation half as often.
logdir	logs/chair/chair_from_nerf2mesh_official	logs\chair\chair_from_nerf2mesh_fast_safe	Different run name and log path; this does not change model math.

Key readout: the main behavior difference is that the better run enables AMP, and it also validates and saves checkpoints less frequently.
